DETAILED ACTION

Response to Restriction/Election

1. Applicants' election without traverse of species III corresponding to figure 5, claims 10-19 as filed on 7/19/2004 has been acknowledged. Furthermore, Applicants are canceling claims 1-9, which read upon non-elected species.

The requirement is still deemed proper and is therefore made FINAL.

Claim Rejections - 35 USC § 112

2. The following is a quotation of the second paragraph of 35 U.S.C. 112:
The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.
3. Claims 17-19 recite the limitation "the second representation". There is insufficient antecedent basis for this limitation in the claims.

Claim Rejections - 35 USC § 102

4. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless --

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

5. Claim 17 is rejected under 35 U.S.C. 102(b) as being anticipated by Haskell et al (5,159,447).

Regarding claim 17, Haskell et al discloses a system for reconstructing an image sequence encoded in a VBR representation comprising blocks of information defining time intervals T_p (Fig. 5; Pack, $P(i+1)_1$, in Stream e) in which number of blocks of information per unit time is greater than baseline ($R(i)$), and T_n ($T/4$) in which number

Art Unit: 2613

of blocks of information per unit time is less (Packs, Pi1, Pi2, Pi3, Pi4, in Stream d) than the baseline, the system comprising:

A receiver (Fig. 1, 45) for receiving a representation of the image sequence via the communication network;

A buffer (40);

A processor (50) for reconstructing frames of image sequence concurrently with the representation being received;

Wherein during the time interval T_n , the processor reconstructs frames of the image sequence based on blocks of information B_n received about in real time (col. 11, lines 25-28), and to store the blocks of information B_p in the buffer (40); and

Wherein during the time interval T_p , the processor reconstructs frames of the image sequence based on blocks of information B_p stored in the buffer (40) and blocks of information received about in real time (Fig. 5, see decoded access units in pack i).

Allowable Subject Matter

6. Claims 10-16 are allowed.

7. The following is an examiner's statement of reasons for allowance:

claims 10-16 recite the novel feature of a system, comprising:

an encoder to provide a VBR representation of an image sequence, the VBR representation comprising a plurality of block information; and

a processor to determine a plurality of time intervals T_p within the VBR representation in which a number of blocks of information per unit time is greater than a baseline value to determine a plurality of time intervals T_n within the VBR representation in which a number of blocks of information per unit time is less than the baseline value, and to create a second representation of the image sequence in which some blocks of information B_p are removed from the time interval T_p and interlaced with blocks of information B_n in the time intervals T_n to reduce a variation in a number of blocks of information per unit time between the time intervals T_p and T_n .

The art of record fails to anticipate or make obvious the novel features as specified in these claims.

Conclusion

8. The prior art made of record and not relied upon is considered pertinent to Applicant's disclosure.
